KORE Fill Cavity Wall Insulation

Wall Insulation Design Guide
**KORE Fill Bonded Bead**

**Key Features**

- Meets and exceeds building regulations
- Suitable for passive house construction
- Installed by insulation experts
- Completely fills the wall cavity
- Eliminates thermal looping - a major cause of heat loss in cavity construction
- Suitable for very wide cavity constructions
- Thermal mass benefits from concrete construction

**Application & Description**

**Application**

KORE Fill is a bonded bead, complete cavity wall fill insulation system for application in new and existing buildings up to 12 meters in height. KORE Fill is approved for use in masonry cavity walls for both full fill and partial fill situations, when a residual cavity wall width of 40mm or greater exists.

**Description**

KORE Fill is expanded polystyrene injected in bead form into a cavity to form an insulating mass. The bead solidifies in the cavity as it’s injected with a special bonding agent. This insulating mass significantly reduces thermal transmittance across the cavity. Filling the cavity completely with KORE Fill will not diminish the original function of the cavity. The cavity will still be able to breath; the bead will not absorb water and will not allow the transfer of water across the cavity to the inner leaf. The product when installed facilitates the control of surface and interstitial condensation in walls.

Typical Construction & U-Value Calculations

Calculation Assumptions

All U-value calculations are in accordance with BS EN ISO 6946:2007. Unless stated otherwise inner blocks have a thermal conductivity of 1.13W/mK. Internal finish unless otherwise stated taken as 12.5mm standard plasterboard with 3mm plaster skim on dabs. Conventional surface resistance; direction of heat flow taken as horizontal. Where applicable air layer is taken as unventilated. Unventilated air layer emissivity surfaces were given due consideration. Calculations that include KORE Thermal Board; the vapour control layer is provided by the plasterboard (Gyproc Duplex Board 12.5mm). KORE Thermal Board applied using plaster dabs and treated as a inhomogeneous layer. Corrections for air layers and mechanical fasteners penetrating the insulation layer were considered. Best practice in terms of workmanship was assumed and therefore the correction factor for air gaps were ignored in calculations for new buildings. A correction factor was applied to calculations for existing buildings. Mechanical fasteners were taken as double triangle stainless steel, number 2.5 per m/sq. These calculations should act as a guide only. Please contract our technical team for a detailed U-Value calculation and condensation risk analysis.

Thermal Bridging

TGD Part L of the Irish Building Regulations states that care must be taken to ensure the continuity of insulation and to limit local thermal bridging and that any thermal bridge should not pose a risk of surface or interstitial condensation.

KORE have undertaken a complete thermal bridging analysis of KORE Fill bonded bead at typical junctions. Please contact our team today to request a copy of these results.
Specification Guidelines

New Building

For specification purposes the exposure zone of the building must be assessed. Further details can be found in our NSAI Agreement Certificate Number 07/0293. Buildings must be assessed in accordance with BS 8104:1992 Code of practice for assessing exposure of walls to wind driven rain together with information provided by the Irish Meteorological Office. Please contact our technical team for further information. The buildings must be surveyed in full by a trained, competent KORE Fill installer prior to verify the suitability of the buildings KORE Fill bonded bead.

Existing Building

The suitability of an existing building must be examined by a trained, competent KORE Fill installer. Where a building is older than 3 years and there is no evidence of moisture ingress or dampness on the internal walls the buildings need not be assessed in accordance with BS 8104:1992 Code of practice for assessing exposure of walls to wind driven rain. In the case of fair faced brickwork recessed mortar joints are not suitable for filing. Only tool flush joint brickwork is acceptable, subject to the following conditions: the minimum cavity is 40mm, there are no signs of dampness on the inner face of the cavity, and mortar joints are in good condition, free from defects which may allow water ingress.

General Design Considerations

- The construction of walls with cavities in excess of 110mm requires adjustments to lintels, wall ties, cavity barriers etc. Therefore cavity walls must be adequately designed in respect of structural stability; fire safety and thermal bridging in accordance with Irish Building Regulations Part A, B and L.
- Where extra wall ties are used in a new building this must be accounted for in the U-value calculation as this may affect the result.
- Electric cables in the cavity shall be run through ducting or be sleeved in accordance with ETCI publication ET 207:2003 Guide to the National Rules for Electrical Installations as Applicable to Domestic Installations.
- Where a flue pipe from a heating system passes horizontally through a wall, the flue pipe shall be separated from the cavity insulation by non-combustible material in accordance with TGD Part J to the Irish Building Regulations.
- KORE Fill Bonded Bead should be separated from the flue in a brick or block work chimney and from any heating appliance by solid non-combustible material not less than 200mm thick. Alternatively, KORE Fill Bonded Bead should be separated by 40mm from the outer surface of a masonry chimney.

Building a Cavity Wall Suitable for KORE Fill Bonded Bead

The best practice points outlined below apply to cavity wall constructions with respect to all insulating materials including KORE Fill Bonded Bead. Each of these is inspected by the KORE Fill installer at the survey stage to ensure the wall is suitable for installing bonded bead. The BRE Good Building Guide GBG 33 was used as a reference.

- Leakage can occur through the outer leaf through joints between bricks and mortar. Rain resistant pointing includes: bucket handle, weathered and struck.
- Mortar extrusions on the cavity face should be cleaned off to avoid large mortar obstructions in the cavity.
- Wall ties must point downwards from inner to outer leaf, drips must be positioned in the centre of the cavity and ties must be kept free from mortar snots. Ideally wall ties should be approved and conform to BS IE EN 845 - 1: 2003. Consideration should be given to the exposure zone when specifying wall ties as outlined in BS 5628-3:2001.
- DPC and cavity tray must be installed to best practice.

Detailed Specification Guide

Full specification guide is available on www.kore-system.com
On Site

Installation Guidelines

KORE Fill bead and bonding agent are injected into the cavity, through drill holes, using specifically designed equipment. The KORE Fill certified drilling pattern insures that the entire cavity is completely filled. Installation of the KORE Fill bonded bead product must only be carried out by KORE or one of our NSAI trained and approved installers. For details of your local installer or our installation manual please contact our team today.

Consult our KORE Fill Installers Register for approved and certified KORE Fill Bonded Bead installers across Ireland and the UK.

Thermal Resistance

Thermal resistance, known as the R-Value, varies with the thickness of insulation. To calculate the thermal resistance (m².K/W) divide the thickness of the insulation by its thermal conductivity and round down the result to the nearest 0.05.

**Durability**

The KORE Fill Cavity Wall Insulation System is rot-proof, water repellent and durable. When installed in accordance with NSAI certification, it is sufficiently stable to prevent settlement and will remain effective as an insulant for the life of the building.

**Behaviour in Fire**

When used in accordance with KORE’s NSAI certification, KORE Fill Cavity Wall Insulation System will meet the relevant requirements of TGD Part B3 of the Irish Building Regulations. Further design details are outlined in NSAI Certificate Number 07/0293.

**Certification**

NSAI Irish Agreement Certification Number 07/0293 in accordance with Building Regulations 1997 to 2012.

**Standards**

KORE Fill Bonded Bead is manufactured to BS EN 13163:2012 under Quality System approved to EN ISO 9001:2008 Quality Management.

**Building Standards**

KORE Fill can satisfy the requirements of the Irish Building Regulations as outlined in:
- Part L - Conservation of Fuel and Energy - Dwellings (2011)

**Design Standards**

The following standards should be consulted regarding the construction of insulated cavity wall:
- BS 5628 - 1: 2005
- BS 5628 - 2: 2005
- IS EN 1996 - 1 - 1: 2006 Eurocode 6

**Environmental**

Expanded polystyrene is BRE Green Guide A+ Rated.

Other Products to Consider

KORE Fill Bonded Bead Cavity Wall Insulation can be used in conjunction with a wide range of KORE products and services. When installing KORE Fill Bonded Bead in a new building, consider the following products:

- KORE’s Passive Slab Insulated Foundation System
- KORE’s Floor Insulation System
- KORE Lock for Cold and Warm Pitched Roofs
- KORE Loft Insulated Attic Flooring System
- KORE’s Range of Draught Proofing Products
- KORE’s Wall and Roof Ventilation Products
- KORE’s Hot and Cold Water Lagging Jackets
- KORE’s Pipe Insulation
